

SUBSURFACE MAPPING

Void and Cavity Risk Management

Cost effective solutions for void and cavity mapping.

Void Mapping

Voids caused by natural features, historic mine working and damage from blasting, represent a serious risk to mining operations.

Traditional drilling investigations for voids and cavities are costly, time consuming and often fail to adequately mitigate the residual risk posed by such voids and cavities.

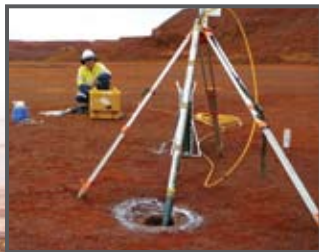

Geoforce Solutions:

Geoforce provides high resolution information of the mine's subsurface, reducing risk associated with voids, including:

- Rapid screening of at-risk areas
- Detailed 3D scanning of known voids for remediation planning
- Geotechnical collapse risk assessment

Benefits:

- Reduced residual risk
- Significantly reduced downtime from traditional approaches
- Operationally efficient, easy-to-use outcomes
- Reduce risk while maximising productivity
- Increase profitability
